

■ **Description**

FUJI low voltage current-limiting fuses are designed to give protection to power supply and distribution circuits and equipment such as motor starter and semiconductors.

Since they can be supplied in a variety of types and ratings any circuit capacities can be accurately matched. FUJI current-limiting fuses have a high interrupting capacity and will prevent thermal and mechanical damage from heavy short circuits.

AF97-635,634

■ **AFaC and BaC type current-limiting fuses**

These fuses have a high interrupting capacity of 100kA at 600V AC or DC and are suitable for power and control circuits. The fuse is a plug-in type, and it can easily be replaced by removing a screw cap.

■ **Rated current:** 3 – 400 Amps

For further information see page 08/26.

AF97-642

■ **FCF and FCK type current-limiting fuses**

These fuses are provided with special links with low-temperature melting characteristics, and are suitable for general power circuits because of their high interrupting capacity and good current-limiting performance. They are available in two types, a center-blade type and a solid ferrule type, with an insulated fuse body of high quality porcelain.

■ **Rated current:** 1 – 600 Amps

For further information see page 08/29.

AF97-635,634

■ **BLC, CR and CS type Super Rapid Fuses**

These fuses are used exclusively for the protection of semiconductors, thyristors and silicon diodes. Since their total clearing I<sup>2</sup>t is very small protective coordination with semi-conductors is very easily carried out.

■ **Rated current:**

BLC type: 12 – 140 Amps

CR type: 30 – 600 Amps

CS type: 40 – 4700 Amps

For further information see page 08/31.

■ **Quick selection table**

(CS fuse: Typical value)

Series	Voltage	Interrupting capacity rms sym (kA)					Application
		20	35	50	100	200	
AFaC	600V AC DC	3 to 100 Amps					General use
BaC		125 to 200 Amps					
		250 to 400 Amps					
FCF	500V AC	1 to 60 Amps					General use
FCK	500V AC	3 to 600 Amps					
BLC	550V AC	12 to 140 Amps					Semi-conductor protection
CR2L(S)	250V AC	10 to 600 Amps					
CR6L	600V AC	20 to 600 Amps					
CS5F	500V AC	40 to 1500 Amps					
CS10F	1000V AC	80 to 1500 Amps					
CS15F	1500V AC	450 to 1250 Amps					

# Low Voltage Fuses

## AFaC and BaC types

### AFaC and BaC type current-limiting fuses

600V AC/DC, 3–400 Amps

#### ■ Description

The AFaC and BaC type have an excellent current-limiting performance with an interrupting capacity as high as 100kA at 600V AC/DC. They are suitable for power circuits and control circuit applications including general power cubicles, distribution equipment, motor starters, load centers and control centers. The fuse assembly comprises base, screw cap, fuse link and adapter ring. The universal surface mounting terminals are provided with screws while the rear connection type are supplied with stud bolts. The fuse link can easily and safely be replaced by simply removing a screw cap.

The diameter of the solid ferrule fuse link varies according to the rated current. The higher the rating, the greater the diameter. As a safety feature the screw cap can only be tightened when the fuse link matches with the adapter ring located inside the base. This prevents the cap from being tightened even when fuse

Rear connection type

Surface connection type

Thickness of mounting plate: 3.2mm or less

link with larger ratings is inserted. The operating blown indication tip can be observed through the screw cap window. The tip color indicates the current rating – for instance, pink indicates 3A and red 10A. The tip is ejected to show that the fuse has blown. Both the base and the screw cap are made from a high class

porcelain insulating material to ensure trouble-free operation. The fuse can be replaced without isolating the circuit. Since the fuse link is housed in a highly reliable porcelain barrel it is strong mechanically and thermally with no danger of explosion or production of noxious gases when blown.

200: For 125, 150, 200A  
400: For 250, 300, 400A

#### Screw cap

## ■ Mounting on steel panel

To mount a rear connection base Ba on a steel panel, an insulating plate and some bushings are used. Kits for 30, 60, 100, 200 and 400A base are available. Please specify your base type when ordering.

Two front bushings are used with 100, 200 and 400A base only.

Example: Insulating plate and bushings for Ba30

## ■ Tightening tool

It is recommended that fuses with ratings of over 100A be tightened with a special tool since there is the possibility of overheating if the screw cap is not adequately tightened. This exclusive use tool is sold separately.

## FCF, FCK type current-limiting fuses

500V AC

FCF Up to 60 Amps

FCK Up to 600 Amps

### ■ Description

FCF and FCK HRC fuses use a specially designed low-temperature melting element, a feature of 'dual element' fuses. There is no fuse deterioration due to overcurrent phenomena such as rush current at the time of motor starting and they also feature time-lag operation characteristics. They operate rapidly and positively in the face of destructive short circuit currents. Since they are current-limiting fuses with a high capacity of 50kA (FCF types: 1 – 60 Amps) they are suitable for many types of power and control circuits. The fuse link is housed in a ceramic barrel with

excellent thermal and mechanical characteristics and is packed in silica sand which prevents arcing. Thus there are no fears of explosion or production of noxious gases. The FCF's link end is a solid ferrule-type and available in 1 – 60 Amps ratings. The FCK is a center blade-type and available in 3 – 600 Amps ratings. The fuse links for the 75 Amps FCK and larger sizes are provided with a blown fuse indicator.

## BLC, CR and CS types Super Rapid Fuses

150–1500 Volts AC  
10–4700 Amps

### ■ Description

The FUJI BLC, CR and CS types are extremely reliable fuses which have been specially developed to provide protection for silicon diodes and thyristors and are suitable for inverters using semiconductors or transformers-rectifiers. FUJI Super Rapid Fuses are designed with a very small total  $I^2t$  value which gives them a high speed interrupting action in the face of abnormal currents.

In addition the arc voltage generated at the time of interruption has a low value so that faults will not influence related electric machinery and equipment. These fuses can carry out the protection of many types of circuits rating from the semiconductor overcurrents to destructive short-circuiting faults-i.e. when the

semiconductors short or circuits fail the sound elements will be quickly isolated from the fault circuits.

### ■ Features

- The total clearing  $I^2t$  is small and the semiconductor circuit is completely protected.
- Since the peak arc voltage at the time of interruption is low damage to other equipment does not occur.

- High interrupting capacity of 200kA at 1000V AC
- The CS type is provided with a blown fuse indicator. An alarm contact block (1NO or 1NC) can also be attached.

## ■ Operating indication

### ● Blown fuse indication

FUJI Super Rapid Fuses are available in BLC, CR and CS types. These types have different methods of indicating a blown fuse.

### ● BLC type

A blown fuse is indicated by the color tip on the ferrule of the fuse being ejected as shown in Fig. 1. This can be seen through the window of the fuse holder.

### ● CR type

This fuse does not have a blown indicator but if a trigger fuse is connected as shown in Fig. 2 this will provide the alarm for blown fuse.

### ● CS type

This fuse is provided with a blown fuse indicator. In this case a pin in the contact pad is ejected after the fuse has been blown. If electrical connections for lamps or alarms are required fit the contact block (1NO or 1NC) to the pad as shown in Fig. 3.

## ■ Alarm contact block ratings

Type	Contact	Rated voltage (V)	AC		DC			
			Inductive $\cos\phi=0.3-1$		Resistive load		Inductive load	
			Rated operational current (A)	Rated capacity (VA)	Rated operational current (A)	Rated capacity (W)	Rated operational current (A)	Rated capacity (W)

## ■ Application and selection guide BLC, CR and CS-type – Super rapid fuse

When selecting fuses for semiconductor rectifier circuit protection the following conditions must be satisfied.  
For additional details contact FUJI.

### ■ Conditions of application

1. The rated interrupting current of the fuse must be greater than the estimated short circuit current of the circuit.

$$\text{Available short circuit current of rectifier circuit} < \text{Rated interrupting current of fuse}$$

2. The let-thru current value of fuse must be less than the allowable 1/2 cycle surge current value.

$$\text{Fuse let-thru current value} \leq \text{Semiconductor} - 1/2 \text{ cycle allowable surge current 10ms (at 50Hz)}$$

3. The total clearing  $I^2t$  value which the fuse requires to complete interruption must be less than the allowable  $I^2t$  value of semiconductor.

$$\text{Fuse} - \text{total clearing } I^2t \leq \text{Semiconductor} - I^2t$$

4. The rated current of the fuse must be greater than the average forward current of the semiconductor.

$$\text{Fuse} - \text{rated current} > \text{Semiconductor} - \text{average forward current}$$

5. The rated current and voltage of the fuse must be greater than those of the rectifier circuit.

$$\text{Fuse} - \text{rated current and voltage} > \text{Rectifier circuit} - \text{current and voltage}$$

### Method of application

Semiconductor rectifier equipment has a variety of rectifier circuits. Taking the 3-phase bridge rectifier circuit as an example – Fig. (a) and (b) as shown in the following.

Although the number of fuses used in the line fuse method (a) is half the number used in the element fuse method (b), the fuses must have a larger current capacity.

Fig. (a)

#### Line fuse method

In this method the fuses are connected to the AC line side.

Fig. (b)

#### Element fuse method

In this method the fuses are connected in series to the semiconductor element.

### ■ Fuse ratings

When selecting fuses various factors such as protection, coordination and load, etc. must be considered. However, in this catalog the main matters such as voltage, current and  $I^2t$  only are explained.

#### ● Rated voltage

The rated voltage of the fuse indicates the maximum operational voltage and this also indicates the root-mean-square value of the AC sinusoidal wave voltage. Select fuses having a rated voltage exceeding the voltage obtained by the formula shown in the following table. (Fig. 1)

Do not select current-limiting fuses with rated voltages drastically exceeding the rectifier circuit voltage. It is necessary to consider the arc voltage.

Fig. 1 Rated voltage required by fuses

Wire connection type	Wiring diagram	Rated voltage of Fuse ( $V_{FN}$ rms)	
		For line fuse	For element fuse
Single-phase bridge		$V_{FN} \geq a \cdot E_a$	$V_{FN} \geq a \cdot E_a$
3-phase bridge		$V_{FN} \geq a \cdot E_a$	$V_{FN} \geq a \cdot E_a$
3-phase, double star		$V_{FN} \geq a \cdot \sqrt{3} \cdot E_a$	$V_{FN} \geq a \cdot \sqrt{3} \cdot E_a$

Remarks: The 'a' is a coefficient where the regulation of the AC input voltage is taken into account. This is  $a=1.1$  in case of voltage regulation  $\pm 10\%$ .

Fig. 2 Element current and line current

Wire connection type	Wiring diagram	Element fuse method	Line fuse method
		Element current $I_a$	Line current $I_\ell$
Single-phase bridge		$I_a = \frac{I_d}{\sqrt{2}} = 0.707d$	$I_\ell = d$
3-phase bridge		$I_a = \frac{I_d}{\sqrt{3}} = 0.577d$	$I_\ell = \sqrt{\frac{2}{3}} I_d = 0.816d$
3-phase, double star		$I_\ell = I_a = \frac{I_d}{2\sqrt{3}} = 0.289d$	

# Low Voltage Fuses BLC, CR and CS types Super Rapid Fuses

## • Rated current

The current values in fuses in the line fuse system and the element fuse system are different. Obtain the correct current value from the table on page 08/41 (Fig. 2).

When selecting the rated current of a fuse choose a fuse having an amperage rating greater than the current which flows in the semiconductor if the load is continuous and a fixed current.

If the current which flows in the semiconductor is greater than the rated current of the fuse connect the fuses in parallel. However, in this case, if the numbers of fuses arranged in parallel are 'n', then the I<sup>2</sup>t value of the fuse will be n<sup>2</sup>·I<sup>2</sup>t and n<sup>2</sup> times the I<sup>2</sup>t value of one fuse. This should be taken into consideration when protective coordination is taken into account. In the case of the circuit where the load rapidly varies the fuse element will suffer from mechanical deterioration and be damaged by thermal stress. In loads of this type the deterioration characteristics of the fuse must be closely considered.

Moreover if the fuse current – time characteristics of the fuse selected is less than the overload characteristics of the semiconductor element then complete protection can be obtained. However, if the semiconductor element has a large capacity then protective cooperation is very difficult to arrange. The fuses are used to isolate the shorted semiconductor element circuit from sound operating circuits.

## ■ Total clearing I<sup>2</sup>t

The total clearing I<sup>2</sup>t of fuse is a very important factor when considering the protective coordination of the semiconductor. This total clearing I<sup>2</sup>t is the value where the arcing I<sup>2</sup>t is added to the melting I<sup>2</sup>t. Therefore it is necessary to satisfy the following formula.

$$\text{Fuse - total clearing I}^2\text{t} \geq \text{Semiconductor I}^2\text{t}$$

The total clearing I<sup>2</sup>t of fuse depends upon the operational voltage and interrupting current.

Therefore, for this reason if a 500 Volts fuse is used in a 300 Volts circuit the total clearing I<sup>2</sup>t is reduced by 50–70%. However, the reduction rate varies according to the type of fuse construction. This must be checked and confirmed once more.

## Example

### I<sup>2</sup>t

All I<sup>2</sup>t values are ampere<sup>2</sup> seconds.

The I<sup>2</sup>t data for silicon diodes or thyristor elements are normally given in their respective catalogs. If the A<sup>2</sup>S data is not given in their catalog obtain the value in the following manner. If protection is needed for a 250V, 150A (I<sub>o</sub>) diode having a maximum allowable peak half sine wave current of 2700A, it is important that the fuse has a total I<sup>2</sup>t value lower than that of the diode.

## Calculation

$$\begin{aligned} \text{Maximum I}^2\text{t diode} &= \left(\frac{1 \text{ Peak}}{2}\right)^2 \cdot 0.0167 \\ &= \left(\frac{2700}{2}\right)^2 \cdot 0.0167 \\ &= 30,400\text{A}^2 \text{ Sec.} \end{aligned}$$

From the table (Page 08/38), the fuse with a total I<sup>2</sup>t nearest to 30,400A<sup>2</sup> Sec. is the 260 Ampere fuse (CR 2L-260).

## ■ Interrupting current

The rated interrupting current of the fuse must exceed the maximum value (Symmetrical RMS value) of the estimated circuit fault current.

## ■ Peak arc voltage

In the case of the current-limiting fuse an arc voltage (overvoltage) is generated at the time of interruption due to its fusible element construction. It is necessary to check that this peak arc voltage does not exceed the semiconductor's maximum (Non-repetitive peak) reverse voltage value.

## ■ Current limitation

Select a fuse whose let-thru current value does not exceed the allowable 1/2 cycle surge current of the semiconductor. The allowable surge current is the peak value of the current which in case at 50Hz is allowed to flow for 10ms. In the current-limiting fuse the fault must be cleared in the shortest possible time or in the first 1/2 cycle.

Available current is the current which would flow if the fuse were not current-limiting.

This would cause damage to equipment. Let-thru current is the actual current allowed to flow by the current limiting action of the fuse. A number of let-thru current graphs are given in this catalog and example is given in the following paragraph. The method of reading this graph is provided for your reference.

## How to find a let-thru current – Example

Fuse: 200 Amps 500V

Available R.M.S symmetrical current:  
100,000 Amps

Let-thru peak current (Instantaneous):  
11,600 Amps

Let-thru R.M.S. current

$$11,600 \div 1.7 = 6,800 \text{ Amps}$$

This example clearly shows that while a 100kA (rms, sym) current is available, the fuse limits the current let-thru to 6,800 Amperes (rms, sym).
